

Two Decades of Immigration Has the Sky Fallen Yet?

ALI MDARRRES, PH.D.

Introduction¹

Over the last two decades, a large number of new immigrants have declared the United States as their new home. While the 1980s was heralded as the decade of immigration and held a demographic fascination for policymakers, social pundits, and old-fashioned nationalists who still insist on the validity of political boundaries, the 1990s surpassed the previous decade in an elevated immigration rate, which shows no sign of diminishing. The United States and many other countries in the world are becoming the economic and political destination for over 125 million individuals who live outside their countries of birth. During the entire decade of the 1980s, 5.9 million people immigrated to the U.S., while from 1990 to 1998, 6.9 million did so. Obviously, the story of immigration continues on a profound scale; however, as in other historical periods, while the economy shows signs of health, the anti-immigration literature seems to diminish. Therefore, despite the larger magnitude of immigration in the last few years, the majority of recent anti-immigration measures occurred in the latter part of the 1980s and the early 1990s. It is ironic that, contrary to the wishes of the anti-immigrant faction, their most recent sociopolitical posturing coincided with the largest number of immigrants to the U.S. in any one year since the second decade of the twentieth century. In 1996, when close to one million immigrants were processed by the Immigration and Naturalization Service (INS), little was heard about this watershed event from the national preservationists.

This report is an attempt to provide a demographic analysis of the state of immigration to the U.S. and California, using information from the INS annual reports and digital database, for the period of 1990 to 1998. Since Asian immigration has captured the imaginations of demographers and policymakers, this report will also provide a detailed analysis of this population for the 1990s.

The data utilized in this publication were made available in part by the Inter-University Consortium for Political and Social Research, through the Social Science Database Archive at CSLA. The data for Immigrants Admitted to the United States were originally collected by the U.S. Department of Justice, Immigration and Naturalization Service. Neither the collectors of the original data nor the Consortium

Patterns and Magnitudes³

From 1820, the first year for which we have immigration data, to 1998, 62,000,000 immigrants adopted the U.S. as their home (see Figure 1). To be sure, not all of these individuals have sought or received U.S. citizenship, but a significant majority have never returned to their country of birth. The significance of the last two decades lies in the fact that close to 20 percent of all immigrants who have ever put foot on American soil arrived during the period of 1980 to 1998. These 12.8 million individuals represent the new "peopling" phase in the dynamics of American demography. Unlike their early 20th century predecessors, they are mainly from Latin American and Asian countries. Fueled by a growing post-WW II economy and a shift in immigration policy, the new immigrants have arrived in the U.S. to fill a range of niches from professional to industrial and service sector jobs.

Geographically speaking, what distinguishes the last two decades is the prominence of California as the intended state of residence for most immigrants (see Figure 2). From 1980 to 1998, California's share of annual U.S. immigration averaged slightly over 26 percent (see Figure 3). Within this emerging geography, the traditional urban destination of immigrants has translated into the formation of a new Ellis Island in the greater Los Angeles area, which was chosen as home by slightly over 10 percent of annual immigrants to the U.S. from 1983-1998 (see Figure 4).

As Figure (5) indicates, from 1990 to 1998, California, New York, and Florida each attracted more than half a million immigrants. The top five states for the 1990s immigrants' residence, which include the three above-mentioned states, in addition to Texas and New Jersey, have attracted close to 4.5 million, or over 60 percent, of all immigrants to the U.S. Among them, California and New York remain the leading states in attracting the immigrant population, with Florida gradually increasing in importance (see Figure 6 and Table 1).

Regionally, eastern states continue to attract a large portion of the immigrant population (see Table 1); however, Cali-

fornia appears to be the manifest destiny of new Americans. During this period, seven western states (i.e., Washington, Idaho, Utah, Arizona, Nevada, California and Oregon) attracted close to one-third of all immigrants to the U.S. Of course, as indicated earlier, the 1.8 million California immigrants made up close to 26 percent of all U.S. immigrants in less than ten years. California is, in fact, an anomaly in the western region, and its position as a point of entrance and even as a secondary migration destination for the immigrant population has become increasingly more important.

Juxtaposed against this geography is the relative absence of immigration to the midwestern and some of the mountain states. Ironically, the states with the lowest immigration rates have become home to a growing migrating population from other states (see Figure 7). As immigrants increase their presence in major American cities, the so-called "white flight" has ensued. This is especially true in Los Angeles, where the number of foreign-born population exceeded one-third of the population in 1990, and is estimated to have reached over 40 percent by 2000. The estimated decline of the non-Hispanic white population indicates that counties with the largest loss of this group in the U.S. are: Los Angeles, California; Cook, Illinois; Philadelphia, Pennsylvania; Kings, New York; and Queens, New York. Conversely, the top five counties in gaining a non-Hispanic white population are: Maricopa, Arizona; Clark, Nevada; Collin, Texas; Gwinnett, Georgia; and Wake, North Carolina. With the exception of Maricopa County, the other four counties had a total population of less than a million, and their white population ratio in 1990 ranged from 77 to 98 percent.

The divergent geography of large immigrant cities and smaller to midsize cities, which have become the destination for "white flight," has produced an interesting spatial pattern of race and ethnicity, where inland states are becoming the post-modern suburbs of the coastal states (see Figure 8). In an inverted way, the periphery of the social system is moving inward to contain the fragmented economy of the post-industrial era within the whiter walls of an agrarian-urban disengagement.

³ INS (Immigration and Naturalization Service) data, released through ICPSR (Inter-University Consortium for Political and

During the 1990s, large urban areas traveled down the path of becoming, demographically, minority-majority spaces. However, with the departure of the white population to the American hinterlands, one has to wonder if that journey is less of an abdication and more of an excommunication of minorities.

National Origins and Demographic Composition

The nearly seven million immigrants who arrived in the U.S. between 1990 and 1998 are largely from Latin America, Asia, and Europe. Table (2) provides information on the top 10 countries of origin⁴ per annum. These countries provided over half of all immigrants to the U.S. in each year. Among them, Mexico, with a total of over 900,000, is the single largest source of immigration. This is followed by the Philippines, China, Vietnam, India, and the Dominican Republic, which appear on every annual top-10 list. These six countries supplied close to 3.8 million immigrants from 1990 to 1998, over 40 percent of the total U.S. immigration in this period. Four of the top six countries are Asian, and, as such, the 1990s can be characterized as the era of Asian immigration. Collectively, the Philippines, China, Vietnam, and India provided close to 1.6 million of the immigrants since 1990. This is close to 23 percent of all immigrants to the U.S.

During the 1990s, the rate of non-quota admittance covered close to two-thirds of all immigrants (see Table 3). This poses a question regarding the relevance of the national quotas retained in the 1965 Immigration Act. Rooted in the turn-of-the-century anti-immigration movement, the 1924 Immigration Act had become the way to control the national source of immigration to the U.S. While the 1965 Immigration Act used the quota language, its basic philosophical underpinning was to shift

immigration from a purely supply-driven phenomenon to a demand-driven one. As such, the need for skilled labor and the assumption that the Asian population was aptly poised for such a niche led to the 1965 Immigration Act, which in its final language shifted the hemispheric limitation in favor of Asian countries. However, three decades after the adoption of this Act, we can observe that the original intent has been supplanted by the true nature of immigration, which is driven mainly by family reunification. Based on the 1965 Immigration Act and various initiatives passed since then, in any given year, up to 270,000 immigrants are admitted under the preference system that controls numerically limited immigration⁶. However, it is obvious that, during the 1990s, annual immigration far exceeded the arbitrary upper limit. The percent of immigrants who are exempted from the numerical limitation is reflected in Table (3). These are, by definition, immediate relatives (spouse, minor children, and parents) of U.S. citizens, adjustments of refugees and asylees, and others exempt from numerical limitation, including groups such as ministers and children born abroad to legal permanent residents⁷. Therefore, we can comfortably assume that a majority of non-quota immigrants are, in fact, "family reunification" immigrants. Added to those who arrive under numerical limitation through family reunification preference, it is clear that the 1990s is a continuation in the saga of human migration, which can hardly be confined to neatly defined formulas of immigration demand based on social and economic preferences of the host society.

Demographically speaking, the 1990s immigrants were not very different from those in the 1980s. The new Americans are mainly female (see Figure 9) and around 30 years old. It is interesting that among the 1990s immigrants, women are generally older. As Figure (10) indicates, in almost every year since

⁴ This information reflects immigrants' nationalities, as opposed to place of birth, since the latter category can include those who were simply born in a country, but do not have citizenship. The use of "country of chargeability" is also problematic, since the INS uses this category in a manner that may mix and match different nationalities. For the purpose of this document, immigrants' nationality is used primarily to determine the magnitude of immigration from any one country. Country of chargeability was used only when it was necessary to provide information on specific countries that are omitted from the list of national codes.

⁵ U.S. Department of Justice, Immigration and Naturalization Service, ICPSR 6164, October 1993. p. 5.

⁶ Preferential status is based on either family relationship with U.S. citizens or a legal permanent resident or on needed job skills. Under this system, each immigrant is charged to a specified country. For this purpose, country of chargeability is defined as "... the independent country to which an immigrant entering under numerical limitations is accredited. Independent countries cannot

1990, women are, on the average, 1.8 years older than men. Given that the majority of immigrants are women, this points to two possible demographic dimensions. First, most women do not leave their country of birth prior to marriage, and, therefore, the average female has a higher likelihood of being older than her male counterparts (see Figure 11). During the 1990s, the annual average of married women made up 29 percent of the total immigrants in the U.S.⁹ For men, this value stood at 22 percent. Clearly, marital status is a determining factor in the immigration prospect of women. As Figure (11) illustrates, single male immigrants were only slightly more numerous than married men (i.e., an annual average difference of under 9000), while married women exceeded single women by an annual average number of 63,000.

The second explanation for the higher average age of female immigrants can be found in family reunification, through which family members other than spouses are brought into the U.S. Immigration of parents can be viewed as a cause for the graying factor in the immigration process. Figure (12) illustrates that women have a larger contribution in each age category except for 0-20. Therefore, as indicated earlier, men are more likely to immigrate to the U.S. at a younger age; however, within adult age groups, family reunification is more likely to bring the extended family, which apparently includes more women than men.

American Immigration Saga

The overall story of immigration in the 1990s is one of growing magnitudes and accentuation of the patterns set in the 1980s. While Mexico continued to be one of the largest sources of legal immigration to the U.S., a number of Asian countries collectively surpassed Mexico's numbers. The Philippines, China, Vietnam, and India became the largest source of immigration in the 1990s, together supplying a total of close to 1.6 million immigrants. During this era, California, especially Los Angeles, continued to be the major geographic destination for over a quarter of all immigrants. Given this level of spatial selectivity, the story of immigration would not be complete without a detailed assessment of California and its competing immigrant populations, Latinos and Asians. The following section provide

California, Ellis Island of the Late 20th Century

During the 1990s, California attracted 1.8 million of the 6.9 million immigrants to the U.S. With 26.1 percent of all immigrants, California became the capital of immigration and the de facto base for many anti-immigration movements. In the rhetoric developed by the nativists, the nature of California immigration is skewed toward perceptions of despair and poverty, and no answer is provided to how California immigrants may be different from the general pool of immigrants, or whether the apocalyptic images of a Latin invasion are warranted.

As Figures (2) and (3) illustrate, California's immigration ranged from a low of 165,317 in 1995 to a high of 247,253 in 1993. These figures are based on the "state of residence" variable in the INS annual data. With an annual average of slightly over 200,000, California's share of national immigration in the 1990s was very high. Interestingly, the highest rates of immigration occurred in the latter part of the economic downturn and the height of the anti-immigration movement. The decreased immigration rates after 1993, while they can be interpreted as being affected by immigrants' changing perceptions of California, are nonetheless higher than most years during the 1980s. The sharp rise of immigration in the U.S. during 1992, 1993 and 1996 corresponds to a more modest increase in California (see Figure 2). This may be an indication that, despite the typical anti-immigration literature, many immigrants respond to the job market, and, as such, do not saturate a region with unemployment. Figure (3) also illustrates that California's share of national immigration has declined substantially since 1992. However, during 1997 and 1998, California's share returned to its annual average of slightly over 26 percent since 1980.

Tables (4) and (5) provide information on the national make-up of the California immigrants in the 1990s. Comparing these tables with Tables (2) and (3) provides an interesting perspective. The most striking feature is that, despite an average national share of 26 percent for all immigrants, California's share of top 10 nationalities is substantially higher. For example, among documented Mexican immigrants, California attracted over 45 percent of the arriving population from 1990 to 1998. Similar figures for Filipinos, Chinese, and Vietnamese are

indicates that California is the primary destination for some of the largest groups of immigrants. However, it should be noted that a selected number of immigrants, who may not be nationally significant in numbers, make up large immigrant populations for California. For example, while Koreans are no longer on the national top 10 list, in California, they were on the top 10 list for all years from 1990 to 1998, with the exception of 1993. The cause for this singular decline can be sought in the civil disorder of 1992, during which Koreans were actively targeted.

The top 10 nationalities also make up a larger proportion of immigrants to California than a comparative group at the national level (compare Tables 2 and 4). By 1998, the top 10 nationalities in California were supplying over 78 percent of all immigrants to California. Given that the percent of non-quota immigrants is similar to the national average (see Table 5), it appears that, regardless of their status, social and demographic composition, certain immigrant populations are focused on California and select this state as their intended place of residence in the U.S. From a sociopolitical perspective, this phenomenon can be interpreted as immigrants creating larger geographic, and hence economic and social, presences in this state. In fact, the image of California as an ethnic-immigrant state has not escaped any Californian, or for that matter any American. What is striking is the level to which immigration to the U.S. has become synonymous with immigration to California. This seems to re-emphasize the existing geographies of ethnicity, and as such, can become a point of despair for many nativists. However, regardless of the increasing level of ethnicity and cultural plurality, the economy of California remains as robust as the remainder of the country. Immigration seems to be far from hindering the capitalist outcome. In fact, many immigrants have come here to celebrate the remaining hegemonic form of political economy; therefore, the prosperity of the state is as assured as the capital that these immigrants bring, their ingenuity and entrepreneurial spirit, as well as those investors whose assets have not been baptized in xenophobia.

Demographically, California's immigrants are similar to the overall U.S. immigrant population in this era. In all years since 1990, female immigrants outnumbered men (see Figure 13), and their average age was higher than men (see Figure 14)

among California's immigrants is larger than the entire 1990s immigrant population to the U.S. (i.e., 2.3 versus 1.8). Given the arguments advanced earlier, it can be assumed that female immigrants to California are arriving mainly as spouses and older relatives of current immigrants. Figure (15) illustrates that in all age groups above 20, women are a much larger group than their male counterparts. Comparing Figures (12) and (15) is also indicative of the difference between California and U.S. immigrants in general. Among immigrants 21 years and older, women in California outnumbered their respective age cohorts by an average 16 percentage points, whereas in the U.S. that difference is 13.45 percent.

California's immigrants are also unique in that they are mainly recent arrivals in the U.S. Figure (16) illustrates this fact, by portraying the number of "new arrivals" versus those who have adjusted their status after residing in the U.S. With the exception of 1996 and 1997, in every year since 1990, "new arrivals" outnumber the "adjusted status" population. This is a clear indication of the accelerated nature of family reunification during this era. Anxieties about the future of immigration policies in the U.S. may have pushed the immigrant population to bring their family members faster than would have normally happened.

Geography of California Immigration

California's immigrant population has historically favored a few specific places in the state. A foreign-born population rate of over 30 percent in Los Angeles County in 1990 is indicative of this geography. During the 1990s, immigrants continued to accentuate their sub-regional presence in a selected number of INS districts and counties. In every year since 1990, the Los Angeles INS district received more immigrants than any other in California. This is clearly illustrated by information on the immigrants' ZIP code of intended residence. Figures (17) through (19) illustrate that the Bay Area and Los Angeles County are the most popular destinations for California immigrants. Eighteen ZIP codes received more than 8,000 immigrants from 1990 to 1998. Ten of these are located in the greater Los Angeles area and the remainder are in the Bay Area. This proportion

chosen ZIP codes where there was a large immigrant population present in 1990. Even at a subgroup level, immigrants seem to have favored the sub-regions where their fellow ethnic population lives. Note that ZIP codes with the largest 1990s immigrant population are divided into mid-city, San Fernando Valley, San Gabriel Valley, and Santa Ana communities. The clear division of ethnic geography among Asians and Latinos is observable in this emerging spatial pattern of concentration.

An important aspect of the 1990s immigration geography in California is illustrated in Figure (18). Location quotient is simply a visibility index. It is calculated by dividing the proportion of new immigrants to old immigrants by the proportion of added population in a ZIP code to the existing population in 1990. This technique helps identify all areas within which immigrants have grown disproportionately to the initial immigrant population, as well as the rate of overall population increase in that area. Note that many of the central California counties, which are typically rural, appear on the map. High visibilities cannot only contribute to a higher probability of social frictions in these areas, but also demand attention to service delivery issues. Despite the large population of immigrants in a number of Bay Area, Los Angeles County and Orange County ZIP codes, high location quotient values in some of the neighborhoods may also signal the total transformation of certain communities to a new immigrant area. For example, in 1990, in ZIP code 91206, located in the southern end of Glendale, over 24,000 foreign-born individuals lived among a population slightly larger than 38,000. Since 1990, nearly 14,000 additional immigrants have been added to the population of this ZIP code. ZIP codes with such characteristics abound, signaling the rise of new communities that can hardly be called "ethnic enclaves," since the perceived class structure for the traditional discussion on enclaves does not apply here. For example, in ZIP code 90046, where over 14,000 of the 1990s immigrants have made their home, the socioeconomic status of residents is clearly diverse and ranges across the entire spectrum. What may be emerging is the end result of a massive chain migration formed under the demographic momentum of family reunification. It is family relationships, and hence perceived identities, that contribute to the ethnic geography of Los Angeles, and not its class-based

absence of a white majority, may have become ethnic-based. A tribalized urban geography may also reflect divided politics, an over-abundance of ethnic advocacy, and a rush to adopt hybridated identities that are rooted in the formation of dysfunctional political units, i.e., nations, rather than true cultural identities. Los Angeles' geography is simply a spatial manifestation of decades of racializing and ethnicizing the political structure, as well as the economy, in the U.S.

Asian Immigration as a Case Study

Probably the most striking and intentional dimension of immigration in the post-1965 Immigration Era is the rise of Asian immigration to the U.S. As illustrated by Tables (2) and (4), Asians not only make up one of the largest sources of documented immigrants to the U.S., but their regional concentration in California also gives a new demographic dimension to the population structure of this state, especially in Los Angeles County.

Without a doubt, Asian identity is an American-manufactured nomenclature for identifying a diverse group of people whose coalition under an imposed identity has both political and social implications. Rooted in the census definition of Asians as those who live in Pakistan, India, and all other countries to their east, Asian identity does not, on the whole, correspond with the continent of Asia. Ironically, people from southwest Asia, including Afghanistan, are considered white, and as such, the meaning of Asians has become somewhat convoluted. Asian groups contain a population with diverse religious and linguistic affiliations, whose plural identification, as defined in the U.S., is truly ahistorical.

In order to remain consistent with the census definition, and contrary to the author's belief, this report uses the generally accepted definition of Asians for purely analytical reasons. With that purpose in mind, a subset of the INS data was created using nationality (and country of chargeability for the two countries of Hong Kong and Macao, which were listed under other nationalities) codes designed by the INS. The final data included the following countries: American Samoa, Bangladesh, Bhutan, Burma, Cambodia, China, Fiji, Guam, Hong Kong, India

and Western Samoa.

With 2.2 million immigrants, Asian countries were the source of slightly less than 31 percent of total U.S. immigration from 1990 to 1998. As Figure (21) indicates, while the annual number of Asian immigrants has declined from a high of 302,542 in 1994 to 172,174 in 1998, the importance of California's share of Asian immigration has remained significant. As of 1998, California was still receiving more than 32 percent of its documented immigrants from the listed Asian countries (see Figure 22). For the country as a whole, Asians still provide over 26 percent of the annual immigration.

Within the listed Asian countries, which qualify as Asian in the U.S., only a handful provide the majority of immigrants to the U.S. Table (6) identifies the top 10 nationalities among the Asian immigrants for each year. From 1990 to 1998, these countries provided over 90 percent of Asian immigrants, and as such, form the core culture groups. While the list repeats the name of most countries, the Philippines, China, Vietnam, India, Korea, Pakistan, and Taiwan were among the top 10 nationalities in every year since 1990. With the Philippines as the single largest source of Asian immigration, the top seven countries supplied 1.9 million immigrants in the 1990s, accounting for 85 percent of all Asian immigrants.

For California, this pattern remains consistent with the national picture. As Table (7) illustrates, the top 10 Asian nationalities among the 1990s immigrants provide over 90 percent of all Asian immigrants to the state. Among them, Filipinos, Vietnamese, Chinese, Asian Indians, Koreans, Taiwanese and people from Hong Kong appear on the top 10 list for every year in the 1990s, supplying close to 85 percent of Asian immigrants in this period. With a total approaching 650,000, these seven countries are also the source of slightly less than 36 percent of all immigrants to California during this period. Between nationalities, the share in California varies. For example, while 46.2 percent of Taiwanese, 44.6 percent of Filipinos, 37.9 percent of Vietnamese, 32 percent of Chinese, and 29.7 percent of Korean immigrants come to California (percentages which are above the average immigration share of California), only 19.6 percent of Indian immigrants come to this state. As such, the sociopolitical identity of the Asian collective varies from

regions can be viewed as indicators of future immigration patterns, we can assure that California's Asian community will be largely defined by the five east Asian countries listed above.

Demographically, Asian immigrants are similar to the larger documented immigrant population. In every year since 1990, women have outnumbered men (see Figure 23). This fact remains true for the California share of Asian immigrants in this period as well (see Figure 24). What distinguishes Asians from the remainder of the immigrant population is the mean age by gender. While Figure (10) illustrates a consistent mean age difference of about two years between female and male immigrants to the U.S., Figure (25) indicates that among Asian immigrants, this gap has narrowed from 1990 to 1996, and since 1997, men are slightly older than women. Among Asian immigrants in California, the mean age difference follows the national norm, as opposed to other Asian immigrants during the 1990s. Figure (26) illustrates that while the age gap between men and women has narrowed, women, on the average, were still older than men. What this may illustrate is that California receives a larger share of Asian family reunification immigration than the U.S. as a whole.

In addition to gender-specific age differences, Asian immigrants also appear to be older than the remainder of the immigrant population in the 1990s. Comparison of Figures (10) and (25) illustrates that while the annual average age of male immigrants to the U.S. remained under 30, male Asian immigrants were on the average older than 30 (i.e., only in 1990 was their average age 29.9) and reached a mean of over 32.5 in 1997. This is also true for women. The annual average age for all female immigrants remained consistently between 30 and 31.5 in the 1990s; however, female Asian immigrants achieved an annual mean age of 31.5 or higher during this period. Among California immigrants, a similar pattern seems to appear. While the mean age of male and female immigrants to California is higher than the national average, indicating the importance of family reunification in this state, among Asian immigrants this pattern is even more pronounced. Figure (14) illustrates the mean age of male and female immigrants to California. As indicated by this graph, among women, who were on the average older than men in every year during the 1990s, the average age

never reached 31. Among Asians (Figure 26), the mean age of women never dipped below 33, and for men, it increased from slightly below 31 to slightly less than 33.5 in 1997. Table (8) and Figure (27) provide a summary analysis for mean age by gender for all categories of analysis. As indicated, the oldest cohort has consistently been female Asian immigrants to California, and the youngest is male immigrants to the U.S. These numbers reveal a new dimension in American immigration history. Immigrants no longer fit the "young single male" perception. In fact, they are mainly women and older. This is especially true in California and among the 1990s Asian immigrant population in this state. Figures (28) and (29) illustrate this fact even more markedly. Women are a majority in every age cohort, except for 6-20, among Asian immigrants to the U.S. and, for that matter, to California. Close to two-thirds of all Asian immigrants aged 21-25 are women, and the female immigrants exceed men by at least 10 percentage points in age cohorts "26-30," "36-40," "41-45," 51 through 65 (i.e., three age cohorts), and "81 and older." In California, this is even more pronounced, since in every age cohort above 20, women exceed men by more than 10 percentage points, except for "46-50" and "71-75." Overall, the image of young male immigrants is no longer applicable to the new immigration wave that began in the 1980s. This is exemplified by the Asian immigrants, who made up close to a third of all immigrants to the U.S. in the 1990s.

Geography of Asian Immigration

Asian immigration in the 1990s was targeted mainly to four states: California, New York, Texas, and New Jersey. These states collectively received slightly less than 1.3 million, or 58 percent, of all Asian immigrants. As indicated in earlier discussions, California's share of Asian immigration is slightly over one-third by itself. As Figure (30) illustrates, with the exception of Illinois, the mid-western and mountain states have been only minimally important as destinations for Asian immigrants. However, Asians have chosen both "frost-belt" and "sun-belt" states as their states of intended residence. The logic of this geogra-

phy rests on previously established Asian communities, as well as on economic opportunities available in major American cities. Once the result of the 2000 census becomes available, it would not be illogical to expect a more pronounced concentration of Asian Americans in the U.S. Examining ZIP code-level distribution of Asians in California (Figure 31) illustrates that during the 1990s, Asians have primarily moved to areas where pockets of Asian communities already existed. Among targeted ZIP codes, 15 attracted more than 5000 immigrants during the 1990s. With a total Asian immigration share of over 95,000 (i.e., over 12 percent of all the Asian immigrants in California during this period), these ZIP codes identify the core of Asian communities in California. While it is not surprising to find these ZIP codes mainly in Los Angeles, Orange County, San Diego and the Bay Area, the fact that the largest destination is in Orange County may be of interest to many. ZIP code 92683 attracted over 10,000 Asians during the 1990s, followed by numbers ranging from 6,800 to 8,000 in three other ZIP codes in the Bay Area. Los Angeles County's share of Asian immigrants is over 210,000 during this period; however, only three of the 15 largest ZIP codes of Asian concentrations (i.e., over 5,000) appear in this county (see Figure 32). In order of magnitude, these ZIP codes are 91754, 91801 and 90701. As expected, they are to be found in Alhambra, Monterey Park and Artesia. These ZIP codes had a large Asian population by 1990, and as such have become major destinations for the new Asian immigrant population.

The overall geography of the Asian community (see Figure 32) points to four sub-regions in the South Coast: the San Gabriel Valley, inland Orange County, the South Bay and the San Fernando Valley. As Figure (32) illustrates, the ZIP codes in these sub-regions are spread over diverse socioeconomic neighborhoods; however, it is clear that Asian immigration has been minimal to areas with severely distressed conditions. This is reflected by an overall per capita income of approximately \$10,100 in all the ZIP codes where one or more of the 1990s' Asian immigrants reside. This is only slightly larger than the average per capita income for all ZIP codes, which is slightly

below \$9,700¹¹. Also, as the map illustrates, Asian immigration is focused primarily on neighborhoods where African-Americans are largely absent¹². While co-location with Latinos and non-Hispanic white is also minimal, the absence of Asians from African-American communities could be the direct result of perceived, or real, class differences between these populations. Housing value, access to employment, and presence of a thriving ethnic economy can be seen as additional reasons for segregating these populations from each other.

Naturalization Rate among Asians

One of the major concerns among political activists is the ability of a group to participate and have a voice in the political process. This is usually measured by citizenship and voting rates. While the magnitude of citizenship can be viewed as a group's changing perception from sojourning to permanency, it would be a mistake to assure that adopting American citizenship necessarily equates abandoning one's old culture and/or national identity. In fact, many immigrants become citizens for the convenience that it avails them. Unlike the turn-of-the-century immigrants, many foreign-born U.S. citizens hold dual or multiple citizenships. Regardless, from an American political perspective, it is important to monitor the rate of citizenship among various groups. Among Asians, this will allow for assuring and acquiring a political voice in the decision-making process.

Figure (33) illustrates that since 1969, the rate of citizenship among Asian immigrants has annually increased, reaching values over 220,000 by 1996. Despite the declining numbers in 1997 and 1998, it is apparent that the U.S. immigration environment, as well as the political and economic conditions in Asia, has contributed to a rise in the number of Asians who have chosen the U.S. as their new political home. As impressive as these figures appear to be, a close examination of the 1990s naturalization rates indicates that a large number of Asians have not become citizens. In order to illustrate this point, Figure (34) compares the number of immigrants in 1990 to 1993 who

would have become eligible for citizenship in 1995 to 1998, with the actual number of naturalized Asians from 1995 to 1998¹⁴. The gap between the two numbers is striking for the years prior to and after 1996. Only in that year did the Asian naturalization rate catch up with its eligibility for those who immigrated in 1991. Considering the fact that thousands of Asian immigrants who had become eligible for citizenship had not obtained this status, the 1996 figure is significant only for its rate of achievement. Otherwise, as Figure (34) illustrates, the naturalization rates in 1997 and 1998 have fallen below that of 1995.

While naturalization rates may hold a fascination and an urgency for the community and civil rights activists, the social interpretation of this phenomenon is hardly synonymous with assimilation or even political integration. The fact remains that many Asians and other immigrant groups maintain dual citizenship and certainly do not abandon their ethnic identities, even when they vote. Naturalization rates are more meaningful for building a political constituency and vociferous communities that are more particularistic in their tone than universal, where the extent of their Americanization is defined by their level of political access and/or participation.

Reflecting on Immigration and Identity

The 1990s remind us all that the age of human migration, at a global level, is upon us. With millions of people living outside their country of birth, America has become a major destination for the wandering political and economic nomads of the global village. One of out every ten immigrants who ever came to this country arrived in the short period of 1990 to 1998. The European-ness of the American stock seems to be challenged by the millions who have arrived over the last two decades. In this environment, foreign-born Americans can hardly be a minority. As such, their view of nativists will prompt a more serious participation in the American electoral process, as well as the

¹¹ These figures are derived from the 1990 Census of Population and Housing, STF3B.

¹² California-wide, correlation between total 1990s Asian immigration and the 1990 Latino population, at ZIP Code level, stood

economy. Entrepreneurs, self-selected people with aspirations of social ascendance, immigrants are hardly a passive few who can be forced to assimilate to the fuzzy culture of America. They are a formidable force that is gradually reshaping the American political, social and economic landscapes. Immigration has become more obviously what it has always been, an economic, social and political equity process at the global scale. Immigrants to the U.S. and, for that matter, to European countries, are typically from countries that have been dominated by colonial forces, be it overtly or subtly. Having failed to achieve political, social and economic prosperity in the environments created by these colonial forces, immigrants come to the source to claim their fair share of life among their national genesis. Under this philosophical umbrella, the high immigration flows of Latin Americans and Asians becomes logical. America's post-WWII obsession with creating a chain of allies among the countries that are located along the Asian Pacific rim led to two wars (i.e., Korea and Vietnam) and produced the immigrant population flow that began in the 1970s. As anti-immigrant groups continue to build their rhetoric, they fail to mention America's historical relationship with the very nations that supply the immigrant population.

The dilemma of the American immigration phenomenon; however, moves beyond the simple "peopling" of a country and its numerical scale. This report directly and indirectly alludes to some of these problems, including the bizarre hegemonic nomenclature invented to group a diverse population together. This is hardly the work of the host society alone. The immigrants, in their search for political power and equitable access, have helped further the cause of these mass-produced identities. The emerging Asian identity is simply a continuing saga in the American history of ethno-genesis, and their geographic distribution is but another chapter in the spatiality of race and ethnicity. Geography has become a surrogate for manifesting the American sociopolitical condition, which has given rise to the production and maintenance of identities whose meaning outside the boundaries of this country loses relevance. However, conditioned by the sociopolitical environment of the U.S., immigrants, regardless of their social status, are more likely to adhere to their given ethnic identities than their socioeconomic

of these ethnic identities is a tool to assure equity in a system that rarely values the common individual, and is more likely to give in to "pressure groups." Ethno-genesis is an important by-product of the American sociopolitical engine and its demise would be contrary to the logic of the globalization process. In a post-hegemonic phase of producing and consuming the culture of nationalism, immigration and ethnicity introduce the balance needed to counter the disruptive forces of nation building here and abroad. The tribalization of America is the logical response to over 200 years of history in creating dysfunctional governance tools, called "states," and their pseudo-cultural reflections, manufactured "nations." As messengers of modern governance and electoral democracy, western countries, especially the United States, are simply harvesting the fruit of a post-colonial era. The extent to which the new immigrants become agents of change in their new and old countries, through capital and social connections, will determine how effective they will be as counter-colonizing forces in their host societies. As immigrants introduce diversity in the engine of globalization and its related capital investment, they will become a formidable force for the creation of a culturally heterogeneous economy. Viewed in this manner, immigration is the necessary tool for deconstructing nations, monopolies of power, centralized economies and, for that matter, everything modern. As global nomads, immigrants are the messengers of post-modernity, and they mirror images of what the world could be like in all its multiplicities in the future.

TABLE 1: Annual Immigration by State of Residence
